

Fact sheet 3

Flush toilet with onsite treatment in twin pits

Summary

This fact sheet describes a flush toilet system with onsite treatment in twin pits. The system consists of a toilet, a pipe, and two pits. The toilet is used to flush waste into the first pit. The waste in the first pit is treated by natural processes. The treated effluent then flows into the second pit. The second pit is used for growing crops. The system is suitable for rural areas with access to water and land.

Applicability

This system is applicable in rural areas with access to water and land. It is suitable for areas with a high water table and where the soil is permeable. The system is not suitable for areas with a low water table or where the soil is impermeable.
